Conclusion

A deep recession in 2012-13:

- GDP dropped around  $-6.8\%$  in 2012 and  $-1.9\%$  in 2013
- private investments declined by  $17\%$
- government investment plunged  $60\%$
- Real trade balance declined  $57\%$

Conclusion

## international sanction

- restrains imports of intermediates with imposing extra financial costs
- boycotts Iran's exports.

Results

Robustness Check

Conclusion

- Households maximize their expected utility over per capita consumption ( $c_t$ ) and per capita labor ( $l_t$ )

$$\text{Max} \sum_{t=0}^{\infty} \sum_{s^t} \beta^t \cdot \pi_t(s^t) \cdot u(c_t(s^t), l_t(s^t))$$

$$u(c_t, l_t) = \frac{(c_t(1 - l_t)^\alpha)^{1-\sigma} - 1}{1 - \sigma}$$

- Households are subject to the budget constraint:

$$c_t + (k_{t+1} - k_t(1 - \delta)) = w_t \cdot l_t + r_t \cdot k_t + T_t$$

Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- Aggregate final output  $q_t$  combines composite value-added goods  $z_t$  and imports  $m_t$  according to

$$q_t = z_t^\alpha m_t^{1-\alpha}$$

- The representative producer of the final output  $q_t$  chooses  $z_t$ ,  $m_t$  to solve this problem,

$$\text{Max } q_t - \nu_t z_t - e_t m_t - \theta_t r_t e_t m_t$$

- $\nu_t$  the price of composite value-added  
 $e_t$  the real exchange rate  
 $\theta_t$  fraction of imports that firms have to pay in advance for input bills  
 $r_t$  rental rate on capital
- The financial frictions are  $\theta_t$  and look like the working capital in *Neumeyer and Perri (2005)*

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- The composite value-added goods are produced from capital  $k_t$  and labor  $l_t$  according to

$$z_t = F(k_t, l_t)$$

- The representative producer of the composite good  $z_t$  chooses  $k_t$  and  $l_t$  to solve this problem

$$\text{Max } v_t z_t - w_t l_t - r_t k_t$$

- We can describe export and import as

$$x_t = \xi_t \times (e_t)^\psi$$

$$x_t = m_t$$

- $\psi$  is the price elasticity demand for domestic final goods
- Boycotts reduce the level of  $\xi_t$

# The Benchmark Economy

## Household

Can International Sanctions Cause Stagnation? A Macroeconomic Analysis of International Sanctions on Iran's Economy

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- The economy has five stochastic exogenous variables

$$s_t = (A_t, (1 - \tau_{l,t}(s^t)), (1 + \tau_{x,t}(s^t)), g_t, \tau_{m,t})$$

- In each period, households and firms maximize their problems by knowing  $S_t$  and  $K_0$
- Households maximize the same objective function with this budget constraint:

$$c_t(s^t) + (1 + \tau_{x,t}(s^t)).x_t(s^t) = (1 - \tau_{l,t}(s^t)).w_t(s^t).l_t(s^t) + r_t k_{t-1}(s^t) + T_t(s^t)$$

# The Benchmark Economy

## Firm

Can International Sanctions Cause Stagnation? A Macroeconomic Analysis of International Sanctions on Iran's Economy

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- A firm's production function is

$$y_t(s^t) = A_t(s^t)(k_t(s^t)^\alpha l_t(s^t)^{1-\alpha})^{1-\gamma} m_t(s^t)^\gamma$$

- Firms maximize their profit in each period:

$$\text{Max } y_t(s^t) - w_t(s^t)l_t(s^t) - r_t(s^t)k_t(s^t) - \tau_{m,t}(s^t)m_t(s^t)$$

- The feasibility constraint in this economy is

$$c_t(s^t) + k_t(s^t) + g_t(s^t) = y_t(s^t) + (1 - \delta)k_t(s^t) - e_t m_t(s^t)$$

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- *PROPOSITION 1*: Consider the four-wedge benchmark economy that has constraint (5) and consumer budget constraint (11). which has the efficiency wedge  $A_t = \alpha \left( \frac{1-\alpha}{1+(r_t \theta_t) e_t} \right)^{\frac{1-\alpha}{\alpha}}$ , the labor, and investment wedge given by  $(1 - \tau_{l,t}) = (1 - \tau_{x,t}) = 1$ . Then the equilibrium allocations for aggregate variables in the detailed economy and this prototype economy are the same.
- The effects of sanctions are manifest in the efficiency. However, we know from *Chari et al. (2007)* that many other frictions map into the efficiency wedge; thus we cannot isolate the effect of sanctions from other frictions.

Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- *PROPOSITION 2*: Consider a benchmark economy that has resource constraint (5) and consumer budget constraint (11) with the efficiency wedge  $A_t = 1$ , the labor and investment wedge given by  $(1 - \tau_{l,t}) = (1 - \tau_{x,t}) = 1$  and the trade wedge  $\tau_{m,t} = (1 + r_t \theta_t) e_t$ . Then the equilibrium allocations for aggregate variables in the detailed economy and this prototype economy are the same.
- Therefore international boycotts and financial sanctions manifest themselves *only* in the trade wedge and not the efficiency wedge. This provides a basis for why we will use the benchmark economy with five wedges

# Calibration

Wedges

Calibration

**Accounting  
procedure**

Results

Robustness Check

Conclusion

- First step: estimating the parameters of the Markov Process

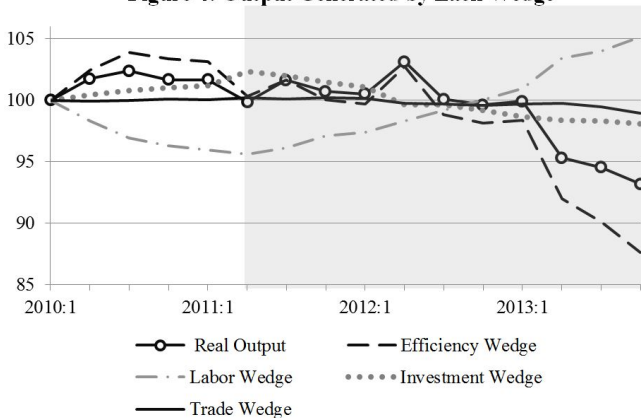

$$s_t = P_0 + P s_{t-1} + \epsilon_t \quad \epsilon_t \sim N(0, \Sigma)$$

- Second step: Measuring the realized wedges
- Third step: Isolate the marginal effects of the wedges

# Results

2012-2013 recession

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

**Results**

Robustness Check

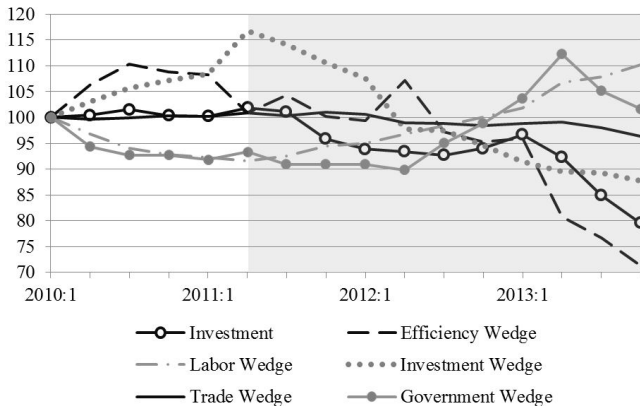

Conclusion

- The efficiency wedge plays a pivotal role in output fluctuations
- The investment wedge explains recession to some extent
- when we fed back the trade wedge into the model, the output decreases 1.1% while real output declines 10%
- The government wedge causes almost no fluctuations in output

# Results

2012-2013 recession

Figure 5: Investment Generated by Each Wedge

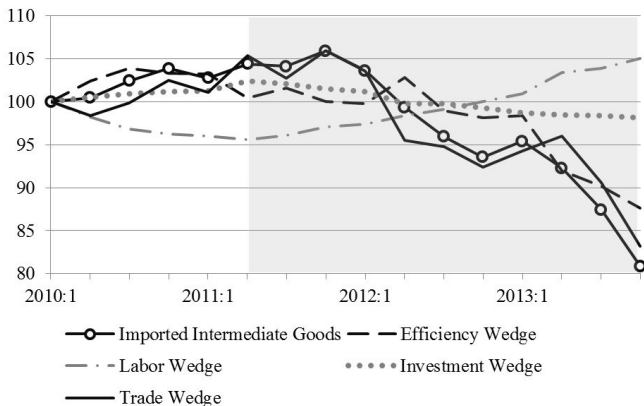

- The investment wedge can explain almost all the decline in investment
- The government wedge and the trade wedge cause a minor decline in the investment in 2013

# Results

2012-2013 recession

**Figure 6: Imported intermediate goods predicted by just one wedge**

- the imported intermediate goods reach their peak in winter of 2011, then drop 25% during 8 seasons. The trade wedge explains almost all fluctuations in imported intermediate goods

# Robustness Check

Can International Sanctions Cause Stagnation? A Macroeconomic Analysis of International Sanctions on Iran's Economy

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

Results

**Robustness Check**

Conclusion

- Capital goods import is also added to intermediate goods import by a calibrated value of 0.12 for  $\gamma$
- Capital goods and final goods import is also added to intermediate goods import by a calibrated value of 0.137 for  $\gamma$
- Use a CES productions function in which elasticity of substitution between imported intermediate goods and GDP is 0.4(two production factors are complementary)

The explanatory power of the trade wedge improved *slightly*

# Conclusion

Can International Sanctions Cause Stagnation? A Macroeconomic Analysis of International Sanctions on Iran's Economy

M. Rahmati  
A. Karimirad  
S.A. Mdanizaheh

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to  
Wedges

Calibration

Accounting  
procedure

Results

Robustness Check

Conclusion

- We have also defined a new wedge called “Trade Wedge” in accordance to Iran’s economy in order to measure the effect of trade barriers, such as exchange rate jumps and sanctions on importing intermediate goods by firms, which has decreased drastically during recession
- The trade wedge predicts only 1.1% decline in output in the 2013 recession, so sanctions that represent themselves by trade wedge have no explanatory power in accounting movements of output

# Conclusion

Can International Sanctions Cause Stagnation? A Macroeconomic Analysis of International Sanctions on Iran's Economy

M. Rahmati  
A. Karimirad  
S.A. Mdanizaheh

Introduction

Outline

The Detailed Model

The Benchmark Economy

The Mapping—  
From Frictions to Wedges

Calibration

Accounting procedure

Results

Robustness Check

Conclusion

- The efficiency wedge explains a great proportion of the fluctuations in output during the recession
- The investment wedge, which accounts for investment movements very well, plays a secondary role
- Other wedges cannot explain them at all
- We do not reject the hypothesis that strict, economic sanctions have no effect; we state that trade barriers such as sanctions cannot affect output through imports and boycotts
